Project Name	Smart Library Request Workflow in ServiceNow
Maximum Marks	2 Marks

Customer Problem Statement:

Academic libraries often face challenges in managing book requests and inventory efficiently, especially during peak periods such as exam season. Students are required to visit the library repeatedly and wait for manual approval, leading to delays, uncertainty about book availability, and reduced satisfaction. Traditional library processes involve manual record keeping, physical registers, and time-consuming approval cycles handled entirely by librarians.

In addition, the absence of a centralized digital request management platform makes it difficult to track book availability in real time, monitor borrowing patterns, and maintain accountability across student and librarian roles. These limitations highlight the need for an automated, role-based, and scalable solution that simplifies library operations while improving transparency and efficiency.

The proposed Smart Library Request Workflow leverages ServiceNow to digitize the entire library management process. The system enables students to request books online and track request status in real time, while librarians manage book inventory, approve or reject requests, and monitor availability through automated workflows. Role-based access control ensures secure operations, and reporting features provide insights into borrowing trends, ultimately improving visibility, accuracy, and efficiency across the library ecosystem.

I'm
A student who wants to borrow books for academic reference but finds it hard to know their availability in advance

I'm trying to
get a book issued quickly, without repeated visits or waiting for manual approval

But
due to lack of real-time visibility, I don't know if the book is currently available

Because
there isn't any centralized digital platform to track requests and inventory

Which makes me feel
using ServiceNow, this problem can be solved efficiently
